5 websites that level up what you build with Claude

Anime.js, Motion, Kokonut UI, Bklit UI and Manus: what each one does, when to use it, and the exact prompts to make Claude build animated, professional-looking websites and dashboards.

LEVEL	READING TIME	COST
Complete beginner	About 20 minutes	Mostly free

Anime.js, Motion, Kokonut UI and Bklit UI are free. Manus has free daily credits and paid plans.

What this guide will help you do

When you ask Claude to "make me a website", it usually works, but it often looks **plain**: no movement, basic buttons, flat charts. Professional sites feel alive because they're built with good **animation libraries** and **ready-made components**.

These five websites give Claude those building blocks. You don't need to learn to code. You need to know **which one to use for what**, and **how to tell Claude to use it**. That's what this guide covers.

What's inside

1. The five at a glance
2. Two ways to build with Claude
3. The one trick that makes it work
4. Anime.js: any animation you imagine
5. Motion: smooth transitions
6. Kokonut UI: ready animated components
7. Bklit UI: animated dashboard charts
8. Manus: an AI agent that builds the first draft
9. Put it all together: one project
10. Good-taste rules, fixes, checklist, glossary

The five at a glance

WEBSITE	WHAT IT'S FOR	USE IT WHEN YOU WANT...
Anime.js	A powerful animation library	Custom effects: text that types itself, shapes that draw, things that move on scroll
Motion	Smooth transitions and interactions	Pages, menus, cards and buttons that move smoothly and feel premium
Kokonut UI	Ready-made animated components	Beautiful buttons, cards, inputs and sections without designing them yourself
Bklit UI	Animated charts and graphs	Dashboards that look professional
Manus	An AI agent that builds for you	A whole first draft (design, dashboard or full website) from just your idea

Before you start: two ways to build with Claude

Way A: a normal Claude chat

At claude.ai or in the app. Best for **one-page** things like a landing page or a single animated section. Claude shows you a live preview. Works great with Anime.js and Motion.

Way B: Claude Code

The **Code** tab in the Claude desktop app (paid plans). Claude builds a real project in a folder on your computer. You need this for Kokonut UI and Bklit UI, which are made for React projects.

Don't worry about the tech words

You'll see words like React, Tailwind and shadcn/ui on these websites. They're just the tools the components are built with. Claude knows all of them. When you use Way B, Claude installs and sets up everything for you. There's a mini glossary at the end if you're curious.

The one trick that makes it work

Claude knows a lot, but these libraries update often. So **always give Claude the link** to the exact page or component you want, and tell it to read that first. This one habit fixes most problems.

THE MAGIC SENTENCE — Add to any prompt

```
Before you start, read this page and follow its latest instructions exactly: PASTE THE LINK
If you can't open the link, tell me, and I'll paste the code or instructions here.
```

1 Anime.js

animejs.com · free and open source

Anime.js is a very powerful animation library. If you can imagine an animation, you can probably make it with Anime.js: text that appears letter by letter, shapes that draw themselves, grids of dots that ripple, numbers that count up, or elements that move as you scroll.

How to use it

1. Open animejs.com and browse the examples and documentation. Find an effect you like.
2. Copy the link to that example or docs page.
3. Ask Claude to use it in your page (Way A or B both work).

COPY THIS PROMPT — Animated hero section

```
Build a hero section for my website about ___ using Anime.js.
- The headline "YOUR HEADLINE" appears letter by letter
- A soft background of dots gently ripples in a wave
- The button bounces in slightly after the text
Keep the animations smooth and under 1.5 seconds in total, and make it look good on
phones too.

Before you start, read this page and follow its latest instructions: ANIME.JS DOCS OR
EXAMPLE LINK
```

Ideas to try

"Draw my logo outline like it's being sketched", "count my stats up from 0 when they scroll into view", "make the cards fly in one after another (staggered)".

2 Motion

motion.dev · formerly Framer Motion · free core library

Motion is the go-to library for **smooth transitions**: pages that slide in, menus that open softly, cards that lift when you hover, and lists that rearrange themselves without jumping. It's what makes a website feel *premium* instead of stiff. It works with plain JavaScript and with React.

Anime.js or Motion?

Use **Motion** for the everyday movement of your interface (opening, closing, hovering, switching pages). Use **Anime.js** for show-off moments (a special hero animation or a drawing effect). Many sites use both.

COPY THIS PROMPT — Smooth transitions

```
Use Motion (motion.dev) to make my website feel smooth and premium:
- Sections fade and slide up gently as they scroll into view
- Cards lift slightly with a soft shadow when I hover them
- The mobile menu slides open and closed smoothly
- Switching between pages or tabs cross-fades instead of jumping
Use spring animations that feel natural, keep everything quick (under 0.4 seconds), and
turn the animations off for people who've set "reduce motion" on their device.

Before you start, read: MOTION DOCS LINK
```

Free vs paid

The Motion library is free. The site also sells "Motion+" with extra examples and tools, but you don't need it for anything in this guide.

3 Kokonut UI

kokonutui.com · 100+ free animated components

Kokonut UI is a big collection of **ready-made animated components**: buttons with particle effects, animated AI chat inputs, smooth drawers, scrolling text, cards and more. Each one is already designed and animated, so you just copy it in. It's made for React projects (it uses Tailwind, shadcn/ui and Motion), so use **Way B (Claude Code)**.

How to use it

1. Browse kokonutui.com and open a component you like.
2. Copy either the **component's page link**, or its **install command** (it looks like `npx shadcn@latest add …`), or the **code** itself.
3. Paste it to Claude Code with the prompt below. Claude installs it and fits it into your page.

COPY THIS PROMPT — Add a Kokonut component

```
Add this Kokonut UI component to my website: COMPONENT LINK, INSTALL COMMAND OR CODE

- If my project isn't set up for it yet (React, Tailwind, shadcn/ui), set that up first and explain each step in one sentence
- Use it for my sign-up button / the hero section / the pricing cards
- Change the colours and text to match my brand: YOUR COLOURS AND TEXT
- Make sure it still looks good on phones
```

Using ChatGPT or a normal Claude chat?

You can paste a component's code into a chat and ask: *"Explain what this does and adapt it for my page."* But to actually run React components, Claude Code is the easiest path.

Check the licence for business use

Kokonut UI is open source, but the licence can differ from component to component. If you're building for a client or a business, check the licence shown for each component you use.

4 Bklit UI

ui.bklit.com · free animated chart components

Bklit UI is the one to use for **dashboards**. It's a free, open-source collection of chart components where everything is animated: line charts that draw in, bars that grow, rings that fill up, live-updating charts, heatmaps and more. Like Kokonut UI, it's made for React projects, so use **Way B (Claude Code)**.

COPY THIS PROMPT — Animated dashboard

```
Build me a dashboard for my online shop / my Instagram stats / my business using Bklit UI charts.

Read the docs first and follow its latest install instructions: https://ui.bklit.com

Show:
- 4 stat cards at the top (e.g. revenue, orders, new followers, conversion rate) with numbers that count up
- A line chart of sales over the last 30 days
- A bar chart of sales by product
- A ring chart of where my customers come from

Use realistic sample data for now, in one separate file, so I can swap in my real numbers later. Make it work on phones.
```

Use your real data

Export your numbers from Instagram Insights, Shopify, Google Sheets or anywhere else as a CSV file, put it in your project folder, and tell Claude: *"Replace the sample data with the numbers in sales.csv."*

5 Manus

manus.im · AI agent · free daily credits, paid plans available

Manus is different from the other four. It isn't a library, it's an **AI agent**. You describe your idea, and it works on its own to research, design and build a first version: a design, a dashboard or a full website. **Your job is the review and the finishing touches.**

How to use it

1. Sign up at manus.im.
2. Describe what you want in detail (use the prompt below), then let it work. It can take several minutes.
3. Review the result: open it on your phone, click everything, read every word.
4. Ask Manus for changes, or download the files and finish it in Claude Code with the other four tools.

COPY THIS PROMPT — For Manus

```
Build a landing page / dashboard / full website for MY BUSINESS OR IDEA.

Who it's for: YOUR CUSTOMERS
What visitors should do: e.g. book a call, buy, sign up
Pages or sections: e.g. hero, features, testimonials, pricing, FAQ, contact
Style: e.g. clean and bright, purple and blue, modern
Websites I like the style of: LINKS

Make it work well on phones. Use placeholder text only where you must, and list
everything I need to replace.
```

Credits can run out mid-build

Manus runs on credits. The free plan gives a small daily amount, and a full website can use most of it. If a big task stops halfway, that's usually why. Paid plans start at around $20 a month (at the time of writing). Check the pricing page for the latest.

Always review

An AI agent can get details wrong: fake phone numbers, broken links, made-up testimonials. Never publish its work without checking every page yourself.

Put it all together: one project

Here's how the five work as a team to build a professional website in an afternoon:

1. Manus Builds the first draft from your idea. → **2. You** Review it and list what to fix. → **3. Kokonut UI** Swap plain parts for animated components. → **4. Motion + Anime.js** Add smooth transitions and one wow moment. → **5. Bklit UI** Add a dashboard page if you need one.

COPY THIS PROMPT — Claude Code, after Manus

```
The folder my-website has a website that an AI agent made for me. Help me finish it
like a professional:

1. Run it and show me how it looks. List anything broken or unprofessional.
2. Replace the plain buttons and cards with these Kokonut UI components: LINKS
3. Use Motion for smooth scroll-in animations, hovers and menu transitions.
4. Use Anime.js for one special hero animation: DESCRIBE IT
5. Check it on a phone-sized screen and fix anything that breaks.

Do one step at a time and show me the result before moving on.
```

Good-taste rules for animation

- **Less is more.** One impressive moment beats twenty things moving at once.
- **Keep it fast.** Most interface animations should take 0.2–0.5 seconds. Slow animations feel laggy.
- **Animation should help.** Use it to show what changed or where to look, not just for decoration.
- **Respect "reduce motion".** Some people get dizzy from movement. Ask Claude to turn animations off for them.
- **Test on a real phone.** What's smooth on a laptop can be jumpy on a cheap phone.

Fixes

PROBLEM	WHAT TO DO
Claude uses an old version and it breaks	Give it the exact docs link and say: "Read this first and use the latest version."
A Kokonut or Bklit component won't work in a normal chat	They're made for React projects. Use Claude Code (Way B), or ask Claude to rebuild the effect in plain HTML.
The page feels slow or jumpy	Ask: "Reduce the number of animations, and only animate position and transparency, so it runs smoothly on phones."
The animations are too much	Ask: "Keep only the hero animation and the hover effects. Remove the rest."
Manus stopped halfway	You probably ran out of credits. Wait for tomorrow's credits, or ask it to continue with a smaller part.
Colours don't match my brand	Give Claude your exact colour codes (like `#6a4cf5`) and ask it to use them everywhere.

Your checklist

- [ ] I bookmarked all five websites
- [ ] I know when to use a normal chat (Way A) and when to use Claude Code (Way B)
- [ ] I added an Anime.js effect to a page using the docs link
- [ ] I made my site's transitions smooth with Motion
- [ ] I added at least one Kokonut UI component and matched it to my brand
- [ ] I built (or tried) a dashboard with Bklit UI
- [ ] I tried Manus for a first draft and reviewed every page
- [ ] I tested the final result on my own phone

Mini glossary

Library	A ready-made toolbox of code that does one job well, like animation.
Component	A ready-made piece of a website, like a button, a card or a chart.
React	A very popular way to build websites out of components.
Tailwind / shadcn/ui	Popular tools for styling websites and adding components. Claude sets them up for you.
Transition	The movement between two states, like a menu opening or a page changing.
AI agent	An AI that works on a task by itself, step by step, instead of only answering one message.
Credits	The units some AI tools (like Manus) use to measure how much work you've used.

Plain websites are optional now.

With these five in your toolbox, Claude can build things that look like a design agency made them. Start with one, and add the rest as you go.
